FarmSync

Phone preview of the web app

Web link

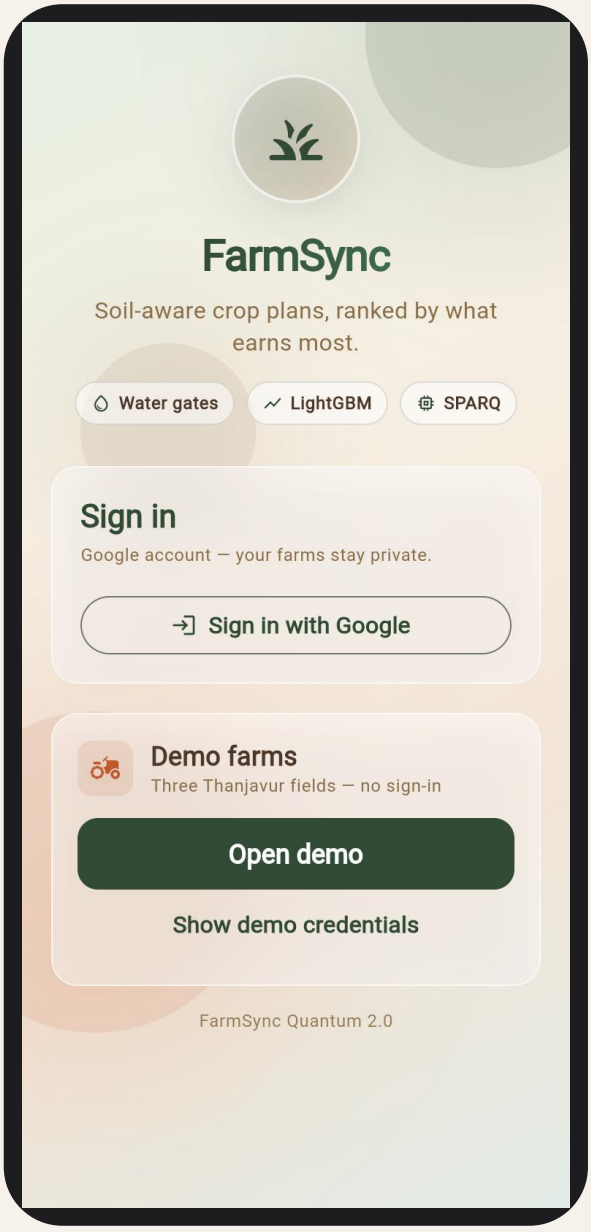

https://aakashxnoir.github.io/FarmSync/

Status. The link goes live after the deploy workflow runs on *main* with GitHub Pages turned on. Until then it returns 404.

Backend. Demo farms load data from the API. The current Railway URL (rjs-production.up.railway.app) returns 404, so set the *API_BASE_URL* repo variable to the new backend before deploying.

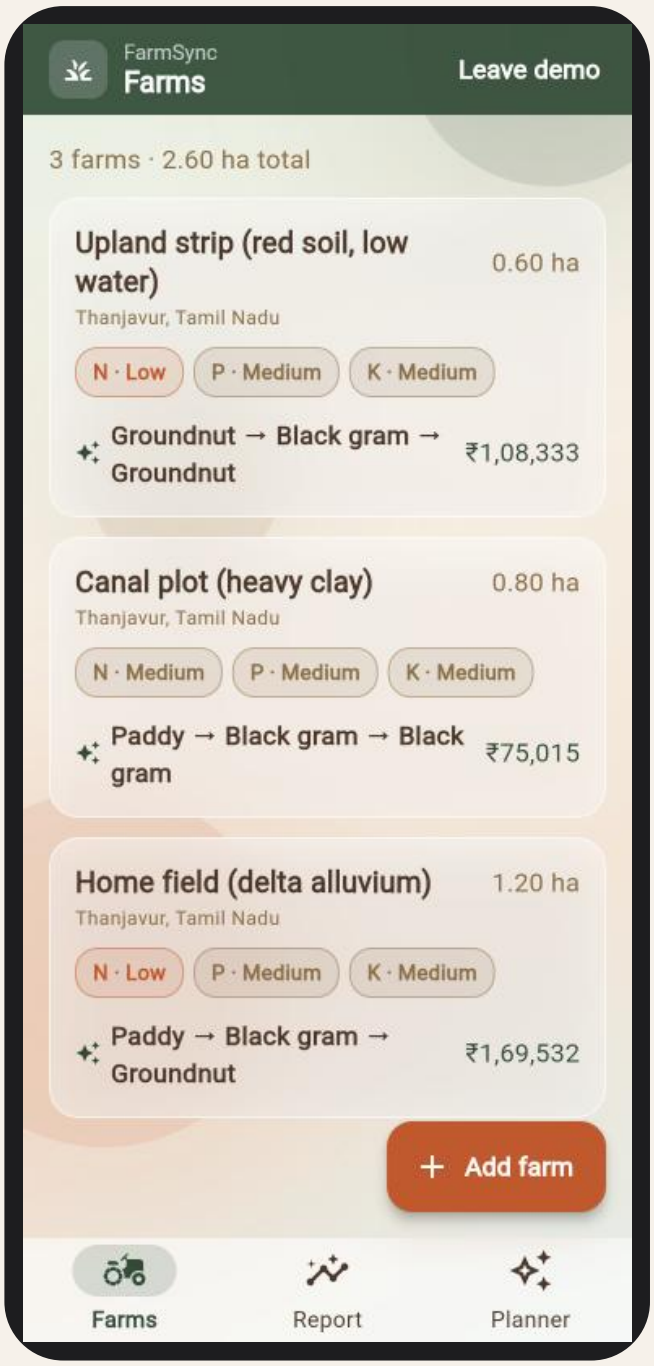

How these screens were made. Same Flutter web code, built and run locally against a local copy of the backend with the three seeded Thanjavur demo farms. Every figure comes from the real pipeline, with no satellite data (degraded mode).

Open on a phone. Visit the link in the phone's browser. It runs as a web app; no install needed.

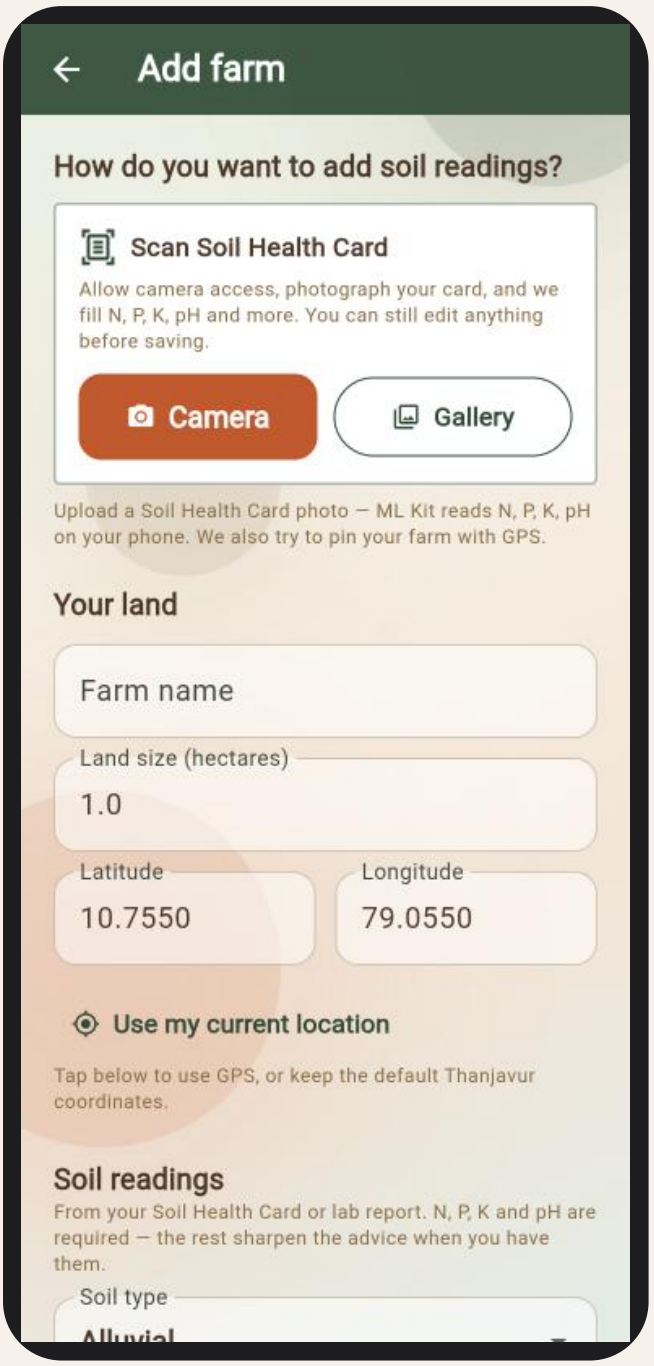

Sign in with Google (Clerk), or open the three demo farms without an account.

Farms

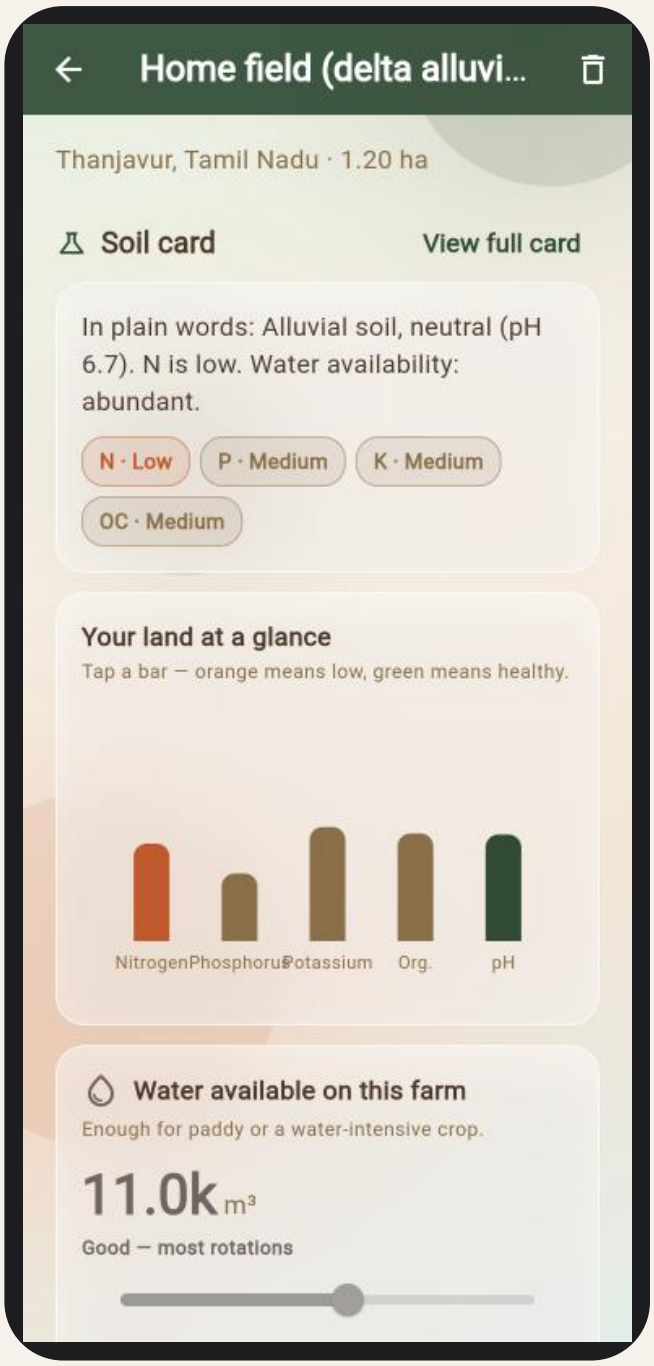

Farm list: N/P/K badges, the recommended three-season crop order and its yearly earnings.

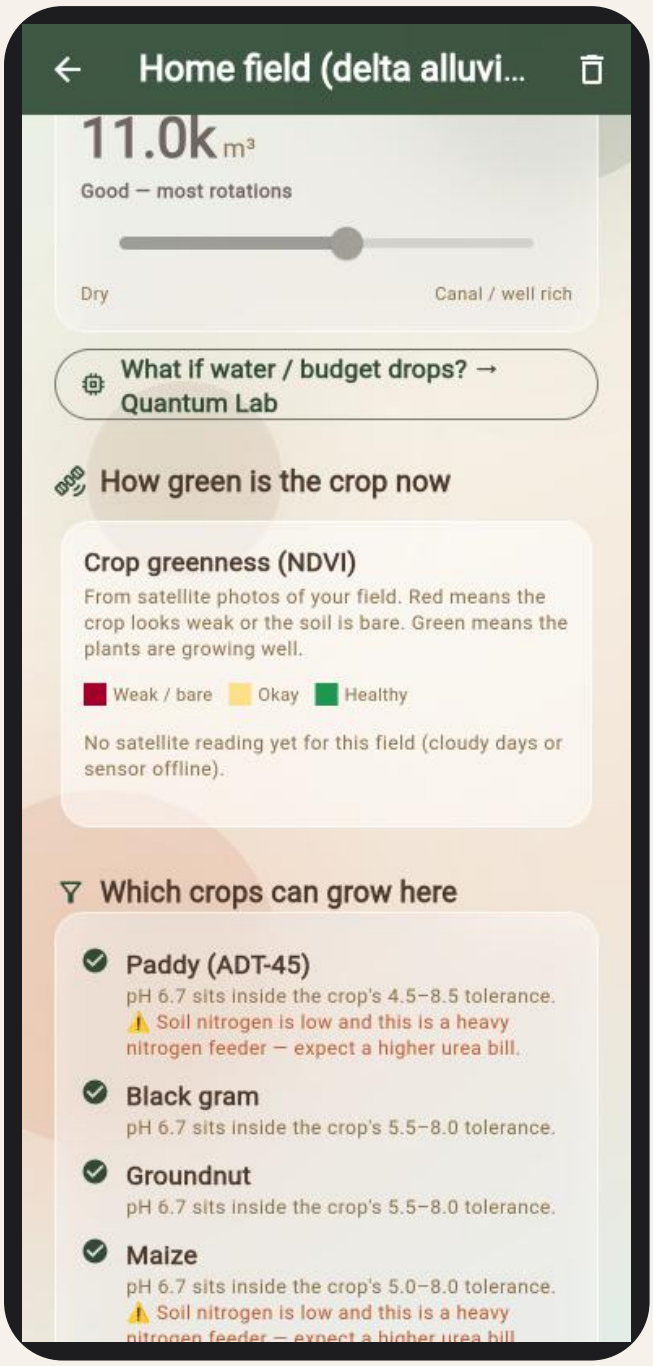

Add a farm: type Soil Health Card readings and location. Card scanning works in the phone app only.

Farm detail

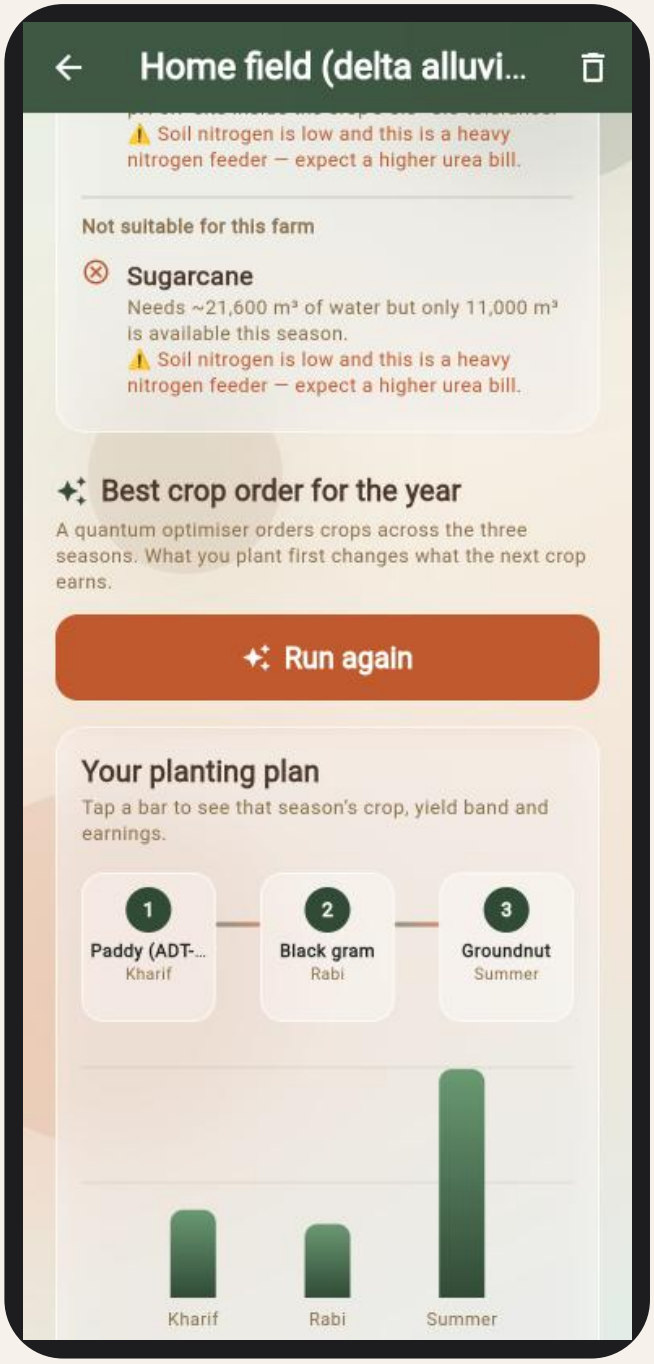

Farm detail: the Soil Health Card in plain words and a nutrient chart.

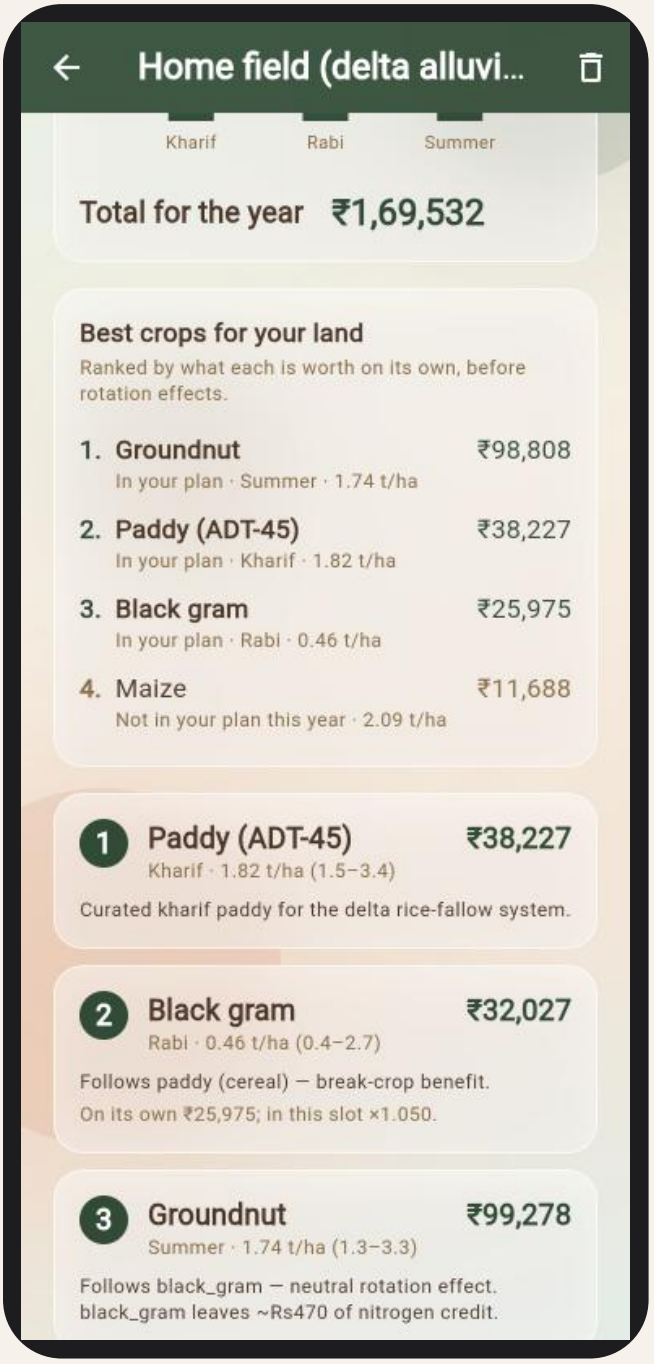

Water available, crop greenness (NDVI), and which crops pass the soil and water checks.

Farm detail

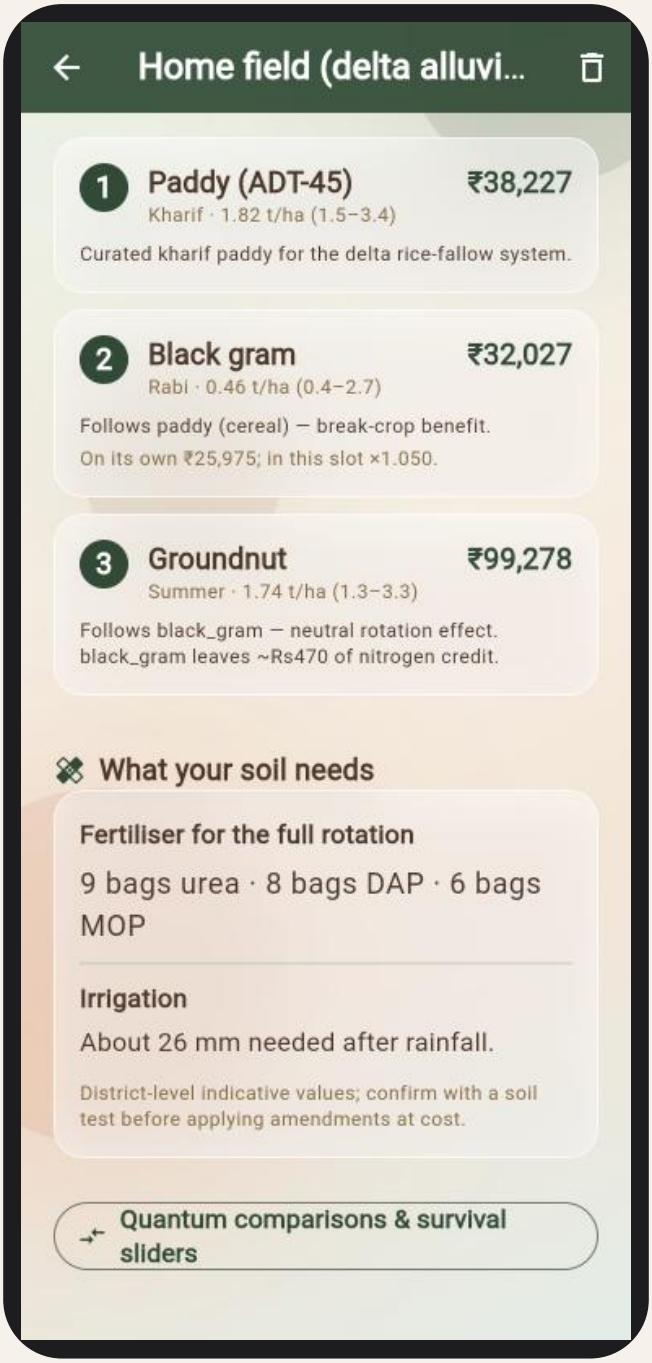

Crops ruled out (sugarcane needs more water) and the quantum-optimised planting plan.

Yearly total, crops ranked on their own, and each season's crop with its yield band.

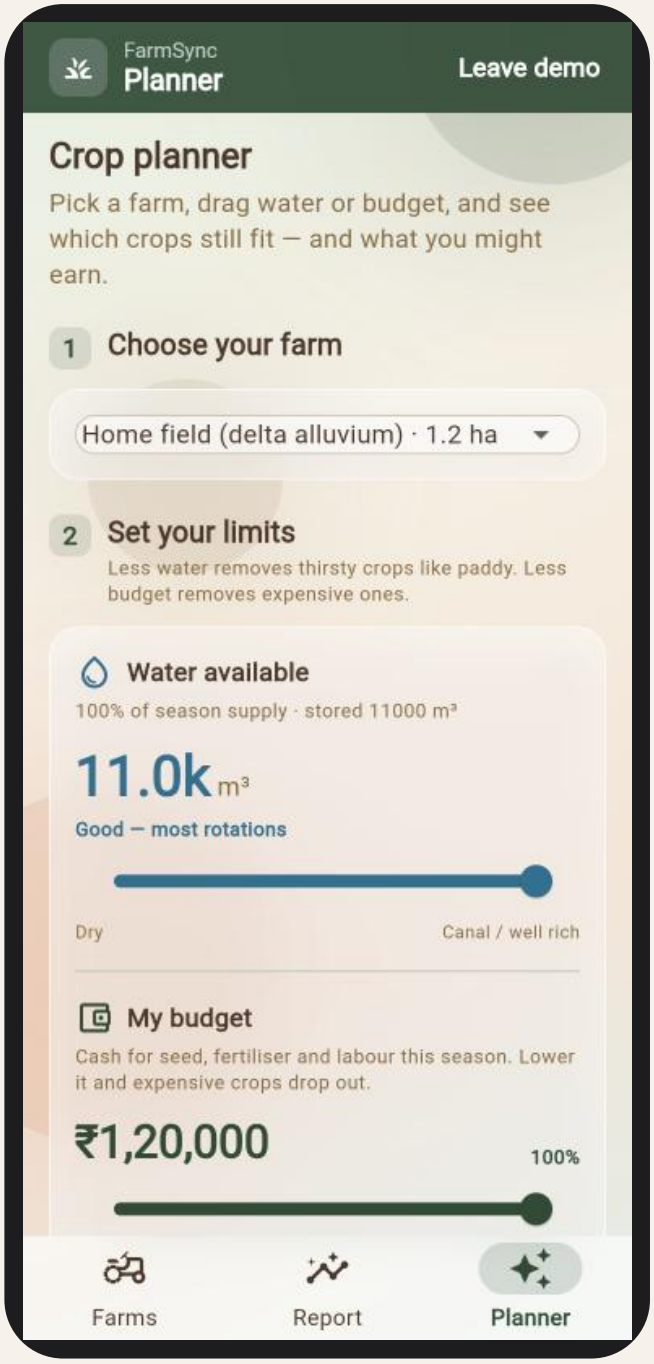

FarmSync web app at phone size (375 x 812). Captured 25 Oct 2026.

Farm detail

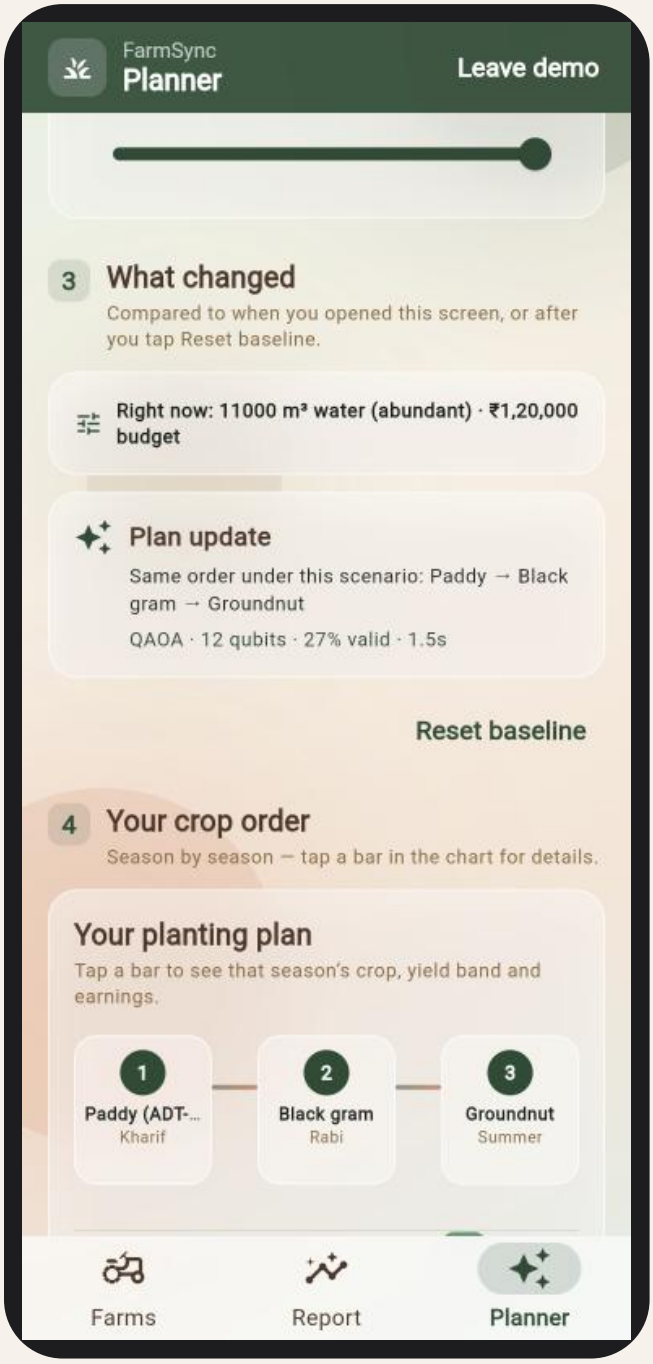

Fertiliser bags for the whole rotation and the irrigation still needed.

Crop planner

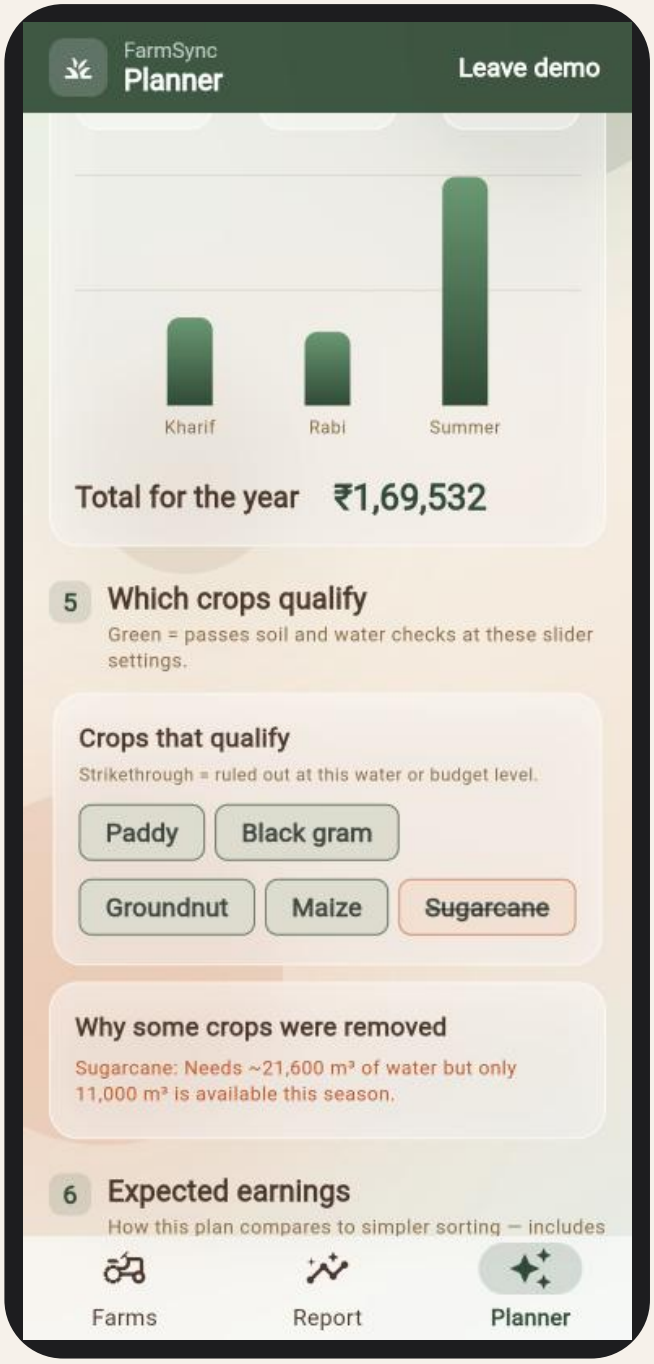

Crop planner: pick a farm, then drag the water and budget limits.

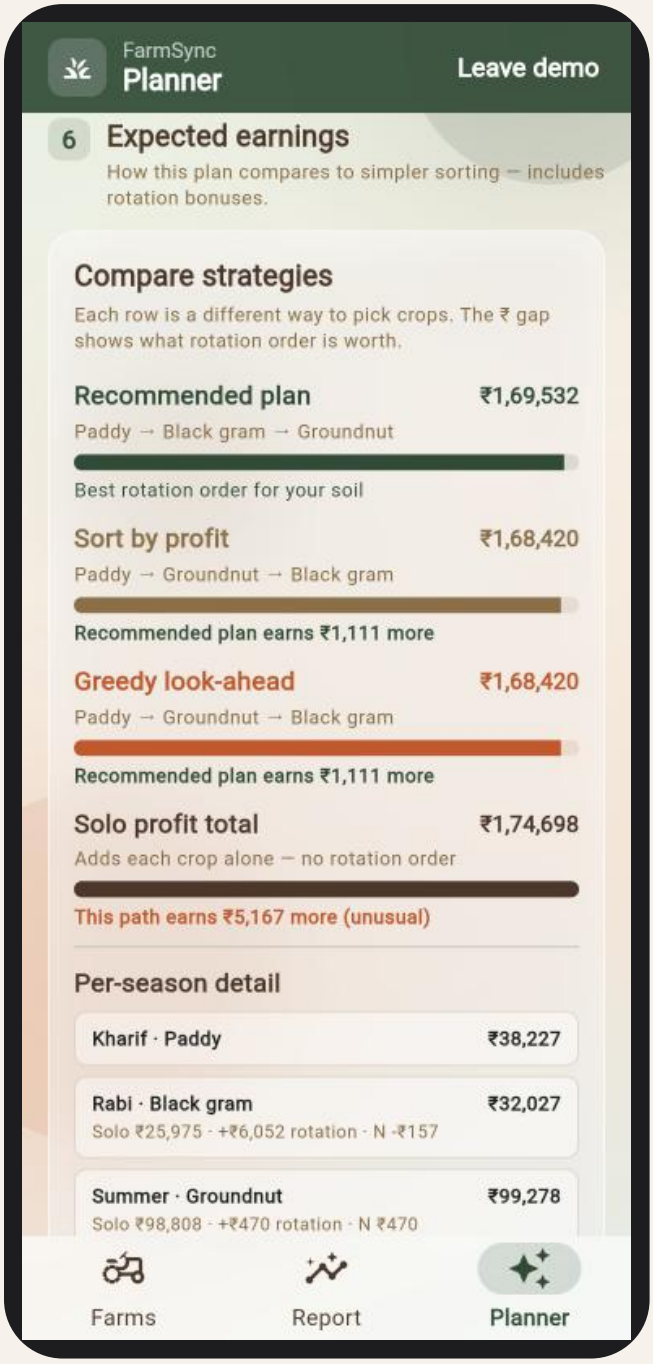

What changed under the new limits, with the optimiser's run stats.

Crop planner

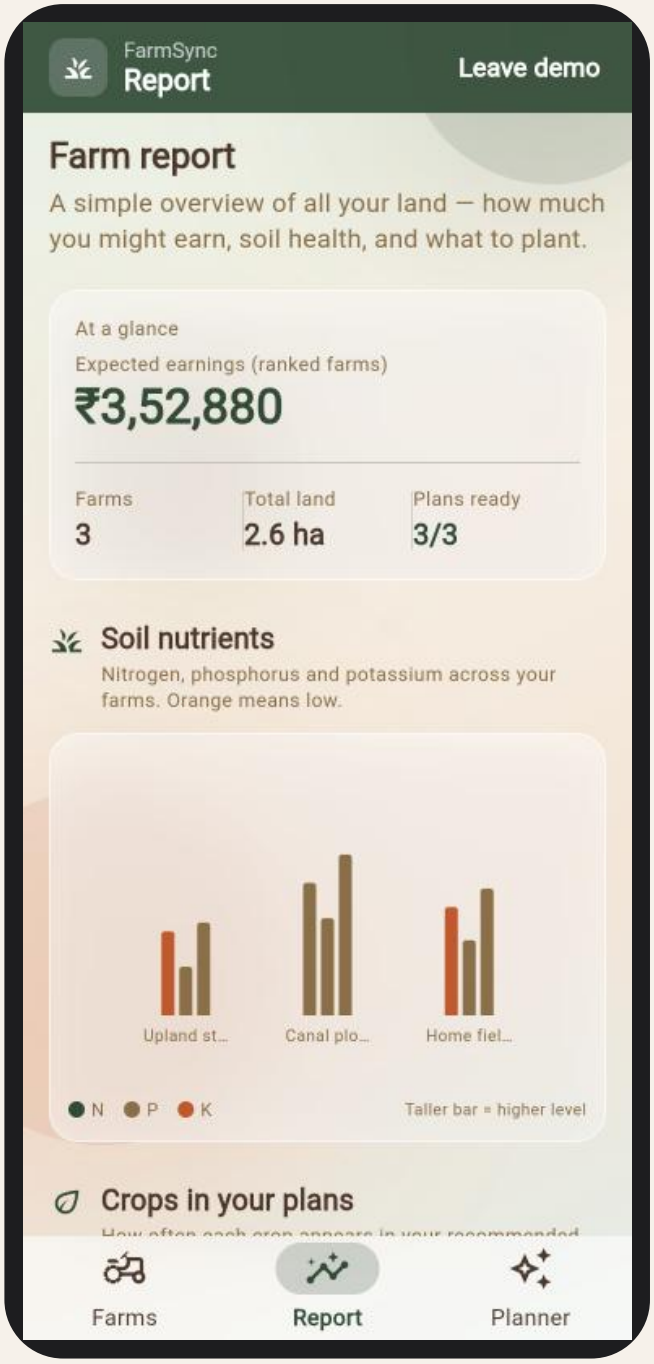

Which crops still qualify at these limits, and why the rest were removed.

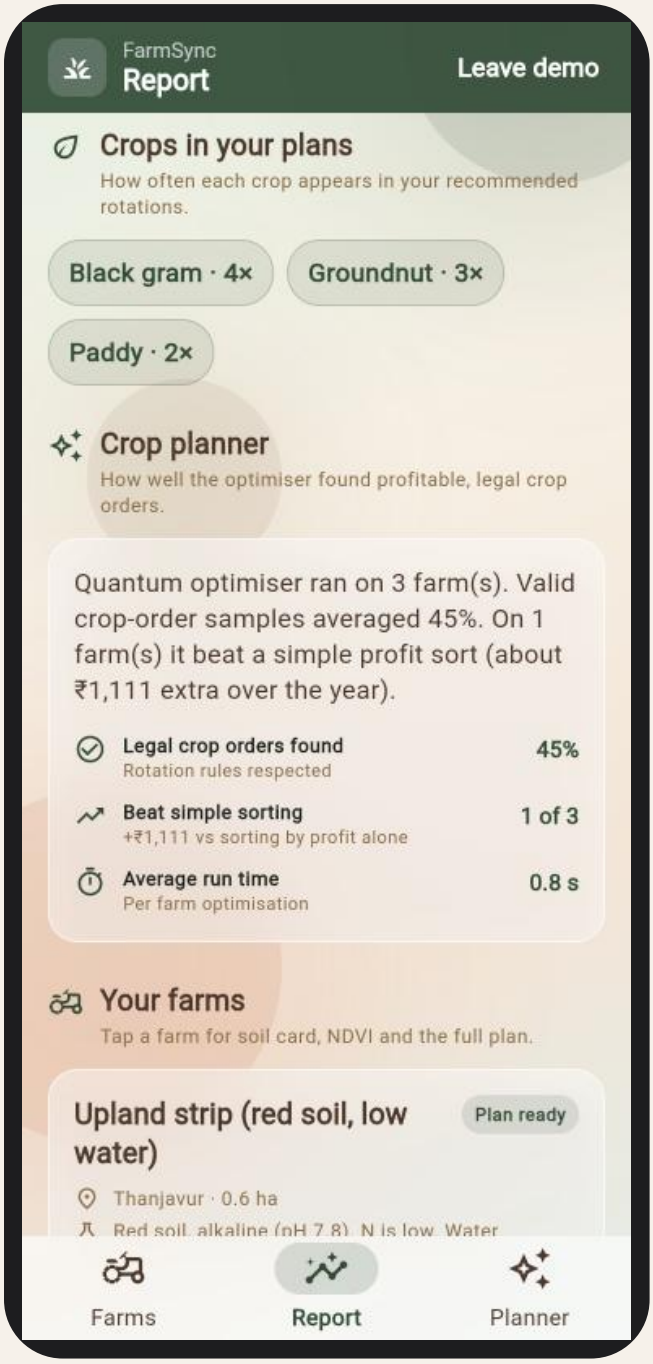

Recommended plan against simpler strategies, with per-season detail.

Farm report

Farm report: expected earnings across all farms and soil nutrients per farm.

Crops used across plans and how the quantum optimiser performed.
